

# A THIRD HYPOTHESIS FOR THE ETYMOLOGY OF THE PORTUGUESE *ATÉ*

Mário Eduardo VIARO<sup>1</sup>

▣ **RESUMO:** Duas hipóteses são correntes para explicar a preposição portuguesa "até": uma delas a associaria ao árabe, enquanto a outra seria o advérbio latino "tenus", raramente utilizado. A nova hipótese apresentada neste artigo – latim "intro" / "intra" – tem uma maior distribuição entre as línguas românicas além de resolver algumas irregularidades de aspecto fonético diacrônico, presentes em ambas as explicações.

▣ **PALAVRAS-CHAVE:** Linguística histórica; preposição; português.

Short words can cause big problems in the historical analysis. The Portuguese adverb and preposition *até* is normally connected with the Spanish *hasta* by the Arabic *ḥatta*, which has the same meaning. However, another completely distinct etymon, that is to say, *\*ad-tenus*, was suggested as an alternative form to explain the Portuguese *até*. In this paper I will propose a third one

The acceptance of each one of those etymons will lead to complex phonetic questions. If the Arabic *ḥatta* is analyzed, the following problems emerge:

– The initial *ḥ*- is a voiceless pharyngeal consonant in Arabic, which normally becomes an *f*- in Portuguese (*ḥurr* > *forro*; *al-ḥalwa* > *alféoa*). In Spanish, the same sound became an *f*- or an aspirated *h*-. There are no examples of an initial pharyngeal Arabic *ḥ*- that was omitted by aphaeresis. In Spanish, there

---

are examples of *fasta*, but *\*fata*, the expected form, is not recorded in the Ibero-Romance languages.

- The geminate *-tt-* normally becomes a *-t-*: the outcome of Spanish, i.e. *-st-*, is also irregular.
- The 'imāla phenomenon in Arabic could explain the sound *é* in *até*. Steiger (1932, p.258) mentioned Arabic transcriptions like *haté*, *hatte*, *hatti*, but in Spanish the vowel is always *a*.

The phonetic problems of *ad tenus*, which would naturally result *\*atēos* or *\*ateos*, were eliminated by a hypothetical vulgar expression *ad \*tenes*. In order to show the soundness of that starting point, very different arguments were considered: Nunes (1945, p.369) is convinced that *tenus* would have an archaic form *\*tenes* (LINDSAY, 1937), which amazingly survived in Portuguese. Silva Neto (1958) attenuated that claim by reasoning that *tenus* had become *\*tenes* by its blending with its synonym *fines*, very similar to what occurred with the etymon *\*finus* for the Italian *fino*, which is the opposite crossed form of *tenus*. If his arguments were accepted, the following presuppositions would have to be assumed:

- *Fines* and *tenus* would occur in a large area of Romania. In the Iberian Peninsula, *fines* is found only in Catalan *fin*s, but nowhere else. No vestiges of *tenus* are found in Italian dialects. Thus, it is difficult to understand the change *fines* > *\*finus* as a crossed form of a word which has not effectively been used. Moreover, *tenus* was a very rare word, even in Classic Latin. The complex form *ad tenus* was never found.
- From *ad \*tenes* it is possible to explain forms like *atēes*, but the dropping of the *-s* is very doubtful. Piel (1960, p.238) admitted that *atēes* came from *ata* followed by the preposition *en* and the paragogic *-s*, which was developed from the analogy with expressions like *(de)pois que*, *des que*, *os que*, *mais que*. That seems to be right, because *atas que* occurs until the 16<sup>th</sup> Century. In the 13<sup>th</sup> Century one can easily find examples of *mentres que*, *antes que*. In the 17<sup>th</sup> Century there were phrases in Sardinian like *innantis de que* (MANOLIU, 1965, p. 343).
- An *s*-less form (*\*attene*, from *\*ad tene*) was proposed by Vasconcelos (1900, p.446), but the dropping of the final *-s*, which is always retained (for instance in the plural accusative of the nouns and in the singular second person of the verbs) cannot be explained.

The assimilation of *ata en* > *\*atāe* > *atēe* is not a problem. Silva Neto (1958, p.760) also acknowledges an *atoo* from *ata o*, and an *ateesta* from *ata esta*. The paragogic *-s* is very clear in other words like *trōes*, which occurs in

the *Cantigas de Santa Maria* (METTMANN, 1959) (from now on CSM), and cannot be explained with both etymons. All those arguments eliminates the hypothesis of an extension of \**tenes*. Other Ibero-Romance forms like *troa* indicate that final -*a* or -*en* is another preposition, i.e. *intro ad* > *troa*, *intro in* > \**troē* > \**trōe* > *trōes*. The complex preposition meaning "limit" are extremely regular in many languages: German has *bis zu*, *bis in*, *bis an*, *bis auf*, *bis nach*; French has *jusqu'à*, *jusqu'en*, *jusque chez*, *jusque vers*; in Romanian has *până în*, *până la*; Italian has *fino a*, *fino in*, *fino da*; modern Portuguese has *até a*.

To sum up, Silva Neto's (1958) arguments for justifying both etymons (the Arabic one for *ata*, *atá*, and the Latin one for *atēes*) are not valid. It is possible to accept a dialectal variation but the etymology is the same for both words.

There are also other variants, which have a close resemblance to the above mentioned *tro*. Silva Neto (1958, p.755) quoted *atro* and *atra*, which he assumes to be mixed forms between *tro* and *ata*. He also quoted crossed forms with final -*s*: *atães*, *ataas*, *tães* (SILVA NETO, 1958, p.758).

So, if the crossed forms hypothesis is abandoned, it is possible to list a large number of theoretical variants (precisely 48) with or without an initial *a-*, with or without a nasalized vowel, with the vowels *a*, *e* and *o*, with or without a consonantal cluster -*tr-* instead of a -*t-*, with or without an ending -*s*. There are only combinations of -*tr+o-*, never \**-t+o-* (\**ato*, \**atōe*, \**atos*, \**atōes*, \**to*, \**tōe*, \**tos*, \**tōes*), and there is no -*tr+e-* (\**atre*, \**atrēe*, \**atrēes*, \**tre*, \**trēe*, \**tres*, \**trēes*). Thus, the hypothetical forms can be reduced to 32 variants. In the *Cantigas de Santa Maria* it is possible to list 15 variants in 84 tokens. My attempt is to arrange all those forms in order to establish their origin, as the scheme at the end of this paper shows.

The following words have no nasalized vowel or -*s*: *ata* (40 times: 47.62%), *ate* (5 times: 5.95%), *atro* (twice: 2.38%). Without an initial *a-* there are; *ta* (8 times: 9.52%), *te* (once: 1.19%), *tro* (6 times: 7.14%), *tra* (twice: 2.38%). There is no *atra*.

With the nasalized vowel there are only: *atēe* (5 times: 5.95%) and *tēe* (once: 1.19%). There are no \**atāe*, \**atrōe*, \**atrāe*, \**tāe*, \**trōe*, \**trāe*. With the final -*s* there are: *atães* (once: 1.19%), *atēes* (4 times: 4.76%), *tēes* (once: 1.18%), *trōes* (8 times: 9.52%). There are no *atas*, *atés*, \**atros*, \**tros*, \**atras*, \**tras*, \**atrães*, \**atrōes*. Forms like *atras* and *tras* would be homonyms with the preposition which is originated from (*ad*) *trans*.

The commonest form is not always the most ancient. The ancientness of *tro* can be compared to that of *ata*, notwithstanding the distance between their token percentages. Therefore, if the most frequent form is not necessarily the

most ancient one, it is possible to suggest another starting hypothesis. If we say that *tra* is so ancient as *tro*, i.e. if *tra* is not considered a crossed word, then we will also be able to contemplate the survival of the pan-Romance *intra/intro* pair in the Iberian Peninsula. Those forms would be the most ancient of all.

It is possible to deduce *ta* from *tra*, which was more often used than *tro*. Other examples of the *-r-* dropping in consonantal clusters are easily found: in the *Cantigas* there are two tokens of *ent* instead of *entre*: *ent'outros* (CSM 37:14), which also occurs in the *Corónica Troiana* and in spoken Asturian. The same can be said for *para* > *pra* > *pa* in colloquial Portuguese, Spanish, Mirandese and Asturian (MENÉNDEZ PIDAL, 1949, p.398; VASCONCELOS, 1900, p.446). That simplification should have happened very early: soon *tro* became soon an archaic word and because of that it hardly appears in other texts. It never developed a form *\*to*. Therefore, we can find at the end of this period, three forms: *tra*, *ta*, *tro*. The speakers in the time of the writing of the *Cantigas* presumably felt *tra* more ancient than *tro*. For that reason, they replaced *tro*, from the manuscript T, by *tra*, in the manuscript E, in the verse CSM 94:33, to preserve an archaic flavor. The three forms *tra*, *ta* and *tro* were followed, from that time on, by the preposition *en*: *tra en* (50% of the tokens of *tra*), *\*ta en* and *tro en* (66.66% of the tokens of *tro*).

In the subsequent period, the apposition of an initial *a-* took place. That prosthetic *a-* is also jointed to other prepositions: *tras* and *atras* (respectively 20% and 80% in the *Cantigas de Santa Maria*) arose from Latin *trans*. The same can be said about *pós* and *após*, *diante* and *adiante*. That *a-* came from the Latin preposition *ad* and occurred in a large number of adverbs, just as *in-* or *de-*. If one admits that *tra* originated *ta*, the form *ata* is easily deductible from *a+ta*. There is also *atro*, but no examples of *atra*: this shows that, before the prosthetic forms, only *ta* and *tro* are effectively used. The form *inté* that is known in Brazilian and European Portuguese, and also in Mirandese (VASCONCELOS, 1900, p.446) comes from an *em+té* (like *empós* from *pós*). The prosthetic forms are also used with *en*: *ata en* and *atro en*.

Without a following preposition, *ata* occurs only 9 times in the *Cantigas*: six times with toponyms, twice with common nouns and once with the adverb "enton". With conjunctions, *ata* occurs once with "quando": *ata quando de Deus tal sinal ouveren* (CSM 309:27) and 24 times (60%) with "que". The phrase *ta que* appears in the majority of the tokens of *ta* (87.5%).

When those phrases were formed, *tra* and *tro* were effectively used only followed by *en*: *tra en que a foi fazer* (CSM 94:33); *da cabeça tro ena verilla* (CSM 19:28). The combinations with *en* correspond to 66.66% of those of *tro* and 15%

of those of *ata*. An evidence of that preposition combination is that there are no phrases like *\*tra que* or *\*tro que*. It is possible to list only the following ones: *ata que*, *ta que*, *ata en que*, *tra en que*, *tro en que*. The form *ata en que* easily became *atãe que* and *tro en que* converted into *\*trõe que*.

The change of *-a > -e* took place from the assimilation of *a* and the preposition *en* that followed *ata* or *ta* (*ata en > ate en*, *ta en > te en*): the only token of *te* in the *Cantigas* is: *des Janua te en Charthes* (CSM 379:21). The whole set of tokens of *ate* are followed by *en*. The only different solution is found in the verse *ata na cima* (CSM 203: 27). All tokens show that neither the vowel *e* nor the nasality can be attributed to Latin *tenuis*. The assimilated *e* was subsequently related to *até* and no longer to *en*. Then: *ata eno > ate eno > atãeno > atee no > até no: até nos fundamentos* (CSM 33:37).

Later, there appeared the forms with *-s*: *atães que*, *atães que*, *tães que*, *trões que*. The optional use of the preposition *en* occurs beside the inherited uses without it as in *tra u se farte* (CSM 366:61), *ta o reyno* (CSM prólogo), *tro o mosteyro* (CSM 94:77); *ata setembro* (CSM 333:51). The analogy also acted on *trões* in this only verse: *trões o convent' a porta* (CSM 59:84).

If the words *tro* and *tra* are really the most ancient and related to *até* not by crossing but by inheritance, it is necessary to assume that the etymons of both archaic words are not either Arabic *hatta* nor Latin *tenuis*, but the pair *intra/intro*, found in all Romance languages. The semantic derivation "inwards" to "until" is undeniable in regard to *tro*. There is no reason to accept another etymon for *tra*.

The aphaeresis of *in-* of *intra* is not surprising: in Italian *infra* originated *fra* with a still more complicated semantic changing. The syllable *in-* was not specially stressed as other disyllable prepositions show: the form *pra* is only deducible from a *\*pará*, not from the *para*. The same is possible to say about *intra* and *infra*: they originated *tra* and *fra* respectively only through *\*intrá* and *\*infrá*.

But not all questions are answered: where does the Spanish word *hasta* come from? The most ancient form in this case is *fasta*. It is harder to solve it, and it is out of the scope of this paper, but if one admits that the preposition *hacia* comes from *\*faz(e) a < Latin faciem ad* through a grammaticalization process like Galician *cara*, it is perfectly acceptable that *fasta* could come from *\*faz(e) ta*. The initial stage *\*fazta* would become *fasta* through adaptations alike to that of Latin *amicitiam > \*amiztad > amistad*. Writing forms as *hadta* could reflect the interdental voiceless sound form /θ/, just as in *iudicare > judgar > juzgar*. Writing alternations with that special *ceceo* in words like *mezquino/mesquino* are common since the time of El Cid (MENÉNDEZ PIDAL, 1949, p. 120,

198). Moreover, there are also dialectal forms such as *fastra* and *hastra* in Galician (CALERO, 1966, p.181; FERREIRO, 1996, p.361), which is thought to be a result a common Galician *st/str* alternation, but a \**faz(e) tra* could be also previewed.

In that way, both prepositions *até* and *hasta* would be related to each other not by a common Arabic origin, but by the same Latin word *intra*. That third etymology for *até* has the advantage of integrating Portuguese forms into the Vulgar Latin. A correlation *de+ex(tra) ... intra* was perhaps the source of its special meaning in the languages of the Iberian Peninsula (MENÉNDEZ PIDAL, 1950, p.375-376). Both previous hypotheses are very doubtful: *hatta* because of its exoticism and *tenuis* because of its preciousness. The set of prepositions is formally very conservative, in regard to other morphological classes, as that of the conjunctions. It is difficult to assume that an Arabic preposition could be so peacefully integrated into this set. On the other hand, the semantic meanings of the prepositions are easily changeable because of the contextual phrases in which they can be used. It is also very unlikely that an archaic postposition (or, at least, rare even in literary contexts) like *tenuis* would have had a so large diffusion in Portuguese as *até* did. When one deals with etymology, it is clear that exotic solutions or preciousnesses do not help, but just increase the unreliability of hypothetical forms.

Other forms found in manuscripts could cause some uncertainty: Menéndez Pidal reports the Leonese prepositions *adta*, *adte* in the 10<sup>th</sup> Century, which would be originated from *hatta*. That is improbable, due to historical reasons: they are certainly representations of the prosthetic forms. The same could be said of *ata* in Spanish, sometimes written *hata*, already in the *Glosas*, together with *troa* (MENÉNDEZ PIDAL, 1950, p.374-376). Precarious information about *fata* in Portuguese and Spanish (mentioned e.g. in MEYER-LÜBKE, 1935, §4077; LOKOTSCH, 1927, p.844) evidence how urgent more precise studies with statistical bases on philologically reliable editions are needed.

Regardless of the existence of preposition *intra* in practically all Romance languages, its principal meanings are the inherited "inwards, into" and the developed "in" and "towards" ones. Also etymons like *intus* and *intus ad* are acceptable in these forms: in Romanian, *în* and *întru* are positional variants. In Arromanian, there are *tu*, *ntu*, *ntru*, *tra*. In Megleno-romanian: *tri*, *tra*, *tru* (ROSSETTI, 1978, p.161-162; COTEANU, 1961, p.258-274). In Dalmatian, there was *ent* (BARTOLI, 1906, p.130). In Logodurese: *intro* (MEYER-LÜBKE, 1935, §4514). In Calabrese: *intra*, *nta*, *ntad*, *nt'*, *ind'*. In Sicilian: *intra*, *nt'*, *nd'*. Neapolitan has *intro*, *indo*, *ind'*. Salernian, Lucanian and Apugliese: *inda*. In Toscan, there is *entro*, but in Dante Alighieri's *Commedia* one can find an expression like *intra tre soli* (*Inf.* 6:69). Umbrian has *entra* (archaic), *t'*, *nt'*. Roman has *nd'*.

Romagnol: *te*. In San Marino, there is *at*. Bolognese and Lucchesan have *ind'*. In Genovese: *int*. In Venetian: *nt'*, *t'*, *int'*. In Istrian: *nt'*, *nd'*. In Triestian: *int'*. Milanese: *ind'*, *int'*. In Bergamo and Trento one says *ind'*. Lombardian has *entro*, *int'*. In Piemontese: *enta*, *té*, *inter*, *nt'*, *ant*, *nta*, *nt'*, *nd'* (ROHLFS, 1969, p.210, 221-224, 227-230, 259). Friulan has *t'*. Sobresselvan has *enta*, *enten*. Old Provençal has a lot of variants, some of them are said to be influenced by Latin *usque*, like French *jusqu'à* comes from *usque ad* (LEVY, 1902): *tro que*, *tros que*, *tro enta*, *entro*, *entro a*, *entro en*, *entroca*, *entroga*, *entrogas*, *entrusca*, *entruscas*, *entruscas a*, *entrusques que*, *troi*, *truei*, *trueque*, *tro a*, *tro en*, *troasca*. Gascon has *enta*, *ta*, *enti*, *ent*, *ende*, *enda*, *nta*, *endà*, *andà*, *enà*, *tad*, *entò*, *entou*, *to* (MISTRAL, 1932). In other Ibero-Romance languages similar forms are found everywhere: in Aragonese, *enta*, *ta*, *troa*, *tro*, *entro* (ROHLFS, 1935, p.36, 137; GIFFORD; HODCROFT, 1966; KONTZI, 1970, p.372-381). In Valencian, *handa*, *anda*. In Maestrazgo, one says *hasda*, *handa*. Old Catalan has an *entrò* and in the dialects of Huesca and Segria there is also an *enta*. Murcian has *inda* (COROMINAS, 1954, *sub verbo "hasta"*).

All those forms evidence that *intra* and *intro* (perhaps also *intus* and *intus ad*) occur in all Romance languages. It is not necessary to realize more complex etymons. The prevalence of *ata* over against the other variants could be reinforced by the bilingualism with the Arabic but it is not the cause of it. Since the speakers already knew the form *hatta*, they had a tendency to prefer *ata*, that sounded alike, but the form *ata* is more ancient than that bilingualism situation, in which it is common to create associative etymologies, like French *choucroute* from Alsatian *sûkrût*, or English *crayfish* from French *crevice*, or French *contredanse*, from English *country dance*. In the set of grammatical morphemes similar phenomena also occur: it is said that Romanian masculine vocative *-e* continues the Latin ending of the second Declension reinforced by Slavic masculine vocative *-e*. Such explanation made easier the acceptance of Slavic feminine vocative *-o* in Romanian. It is not impossible that *ata* and *hatta* acquired a semantic and syntactic similarity to Arabic *hatta* because of that linguistic adaptation, which began to occur in the 10<sup>th</sup> Century, i.e. about 300 years before the *Cantigas*.

VIARO, M. E. Uma terceira hipótese para a etimologia do *até* português. **Revista do GEL**, São Paulo, v.1, n.1, p.91-100, 2003.

□ **ABSTRACT:** *Two hypotheses are current to explain the origin of the Portuguese preposition "até". The first one claims it is related to the Arabic ḥatta would attach it to Arabic, whereas the second one claims it is related to the rarely used Latin adverb "tenus". The new hypothesis – Latin "intro" / "intra" – presented in this paper has a larger distribution within Romance languages and, furthermore, it can solve some irregular diachronic phonetic aspects of both explanations.*

□ **KEYWORDS:** *Historical linguistics; preposition; Portuguese.*
